4. Interpretation of CFP quantification results		
4.1	Interpretation of CFP quantification results	<ul style="list-style-type: none"> <li>• At about 93%, the load at the raw material acquisition stage is very high. This is due to the heavy load associated with stainless steel and copper alloys parts and their processing. The selection of raw materials and the improvement of processing methods are thus both crucial.</li> <li>• The amount of Co2 emissions is low at a distribution stage due to transporting the large quantities of watches at all one.</li> <li>• The amount of Co2 emission at the usage / maintenance stage is related to the replacement of the consumable leather band.</li> </ul> <p>There is no need to replace batteries due to loading a solar cell into this product.</p> <ul style="list-style-type: none"> <li>• When calculating the CFP, we use in-house data for the quantities of raw materials used. Collecting data for many of the components is, however, difficult. For that reason, the data for raw material generation is based on typical values for our processes. As a result, the data sometimes does not reflect the characteristics of this specific product. Kindly understand that, for the above reasons, these results are estimates.</li> </ul>
