| | Value in CFP mark | <Numerical value> 1,400kg | <Unit for the value> per unit product |
| | Description of additional info. | <p>*Calculated by the standard Scenario for MFP (EP type). *Calculated on the basic configuration. *CO₂ emission in the distribution stage assumes Japan as the main sales area. *Electric power in the use and maintenance stage is evaluated with the public electric-power-consumption-rate in Japan. *Print volume is assumed 730,000 sheets. *In this scenario, the CO₂ emissions from copy papers are estimated 5,600 kg-CO₂e at 4.0g per A4 paper. *The CO₂ emission of printing paper is excluded from the use and maintenance stage. *Electric power in the use stage is evaluated based on TEC value which is measured in accordance with International ENERGY STAR Program version 2.0.</p> <div style="text-align: center;">  <p>Disposal & recycling stage 3%</p> <p>Raw material acquisition stage 54%</p> <p>Use & maintenance stage 40%</p> <p>Production stage 1%</p> <p>Distribution stage 2%</p> </div> | |

| 4. Interpretation of CFP quantification results | | |
|---|--|--|
| 4.1 | Interpretation of CFP quantification results | <p>CO2 emission in use and maintenance stage is the largest as 54%. It is important to save energy during product usage.</p> <p>The use condition in this scenario can be different from the use condition of the user.</p> <p>A choice of the use condition (print mode, print conditions and so on) can reduce the CO2 emission during product usage.</p> <p>For example, 140kg-CO2e of the CO2 emissions (approximately 10%) can be reduced if 2-in-1 print is applied to 50% of the estimated total print volume.</p> <p>Primary data is used in the raw material consumption. Secondary data is used in the parts manufacturing process which might not be reflected our own circumstances because it is difficult to collect the data for thousands of the parts. Please understand this result as the rough estimate according to the reason mentioned above.</p> |
