4. Interpretation of CFP quantification results					
		CO2 emission in use and maintenance stage is the largest as 81%. It is important to save energy during product usage.			
		The use condition in this scenario can be different from the use condition of the user. A choice of the use condition (print mode, print conditions and so on) can reduce the CO2 emission during product usage. For example, 2,700kg-CO2e of the CO2 emissions (approximately 20%) can be			
4.1		reduced if 2-in-1 print is applied to 5,548,000 sheets (50% of the estimated total print volume). Primary data is used in the raw material consumption. Secondary data is used in			
		the parts manufacturing process which might not be reflected our own circumstances because it is difficult to collect the data for thousands of the parts. Please understand this result as the rough estimate according to the reason mentioned above.
